

## **PROC SQL EXERCISE (Using Card Data)**

1. Identify number of cards by each card type
2. Total # transactions in each city & Identify top 5 cities with highest # of transactions
3. Create a new data using Customer data with Cust\_ID & Age  
--Create an Age grouping variable using case statement (20-35, 36-50, >50)
4. Create summary - Total Spends by each Card type & Age groups  
-- Join tables Card type & Txn Data & New data from above, to get the total amount spend by each card type & age group
5. Identify the average card limit only for transacting cards,  
--Using correlated query
